APPENDIX 10

SUMMARY OF PROPOSALS

TABLE 3.2 (Page 1 of 3)
REMOTE SENSING PROPOSALS

| Index No. | No. | Proposal | Economic Opportunity | STRATEGIC BENEFIT | | | TECHNOLOGY DEVELOPMENT | | | Space Station Advantage |
|--------------------------|-----|-------------------------------------------------------------------------------------------------------|----------------------|-------------------|--------------------------------|--------------------------|------------------------|-------------|--------------|-------------------------|
| | | | | National Interest | Regional Development | Advancement of Knowledge | Capability | Development | Potential | |
| I-9 | T-1 | High Resolution Synoptic Imaging Radar | Useful | Very important | Contributes | Significant | Growth | R&D | Favourable | Sufficient |
| U-17 | T-2 | Passive Microwave Radiometer with 1 km array | Useful | Beneficial | Moderately Distributed | Significant | Embryonic | Concept | Favourable | Necessary |
| U-21a | T-3 | High-Resolution Micro-wave Scanner | Useful | Beneficial | Moderately Distributed | Significant | Embryonic | Concept | Favourable | Necessary |
| U-6b | T-4 | Determination of shorter wavelength features of earth's gravity field | None | Little importance | Concentrated in existing areas | | Very significant | Embryonic | Concept | Average |
| G-56 | T-5 | Thematic Mapper on 50° Space Station | None | Beneficial | Concentrated in existing areas | Insignificant | Mature | Proven | Unfavourable | Sufficient |
| U-6b | T-6 | Monitoring earth deformations via laser ranging | None | Little importance | Concentrated in existing areas | Insignificant | Embryonic | Concept | Average | Necessary |
| G-18 | M-1 | Topographic Mapping and Surveying Recovery of film from on-board cameras | Major | Beneficial | Well distributed | Insignificant | Mature | Proven | Unfavourable | Necessary |
| I-31 | M-2 | High resolution sensors and geodetic positioning | Minor | Beneficial | Moderately distributed | Moderate | Mature | Proven | Unfavourable | Sufficient |
| U-6b | M-3 | studies of atmospheric refraction with geodetic emphasis(distribution of water vapour in troposphere) | None | Little importance | Concentrated in existing areas | Very significant | Embryonic | Concept | Average | Necessary |
| <u>Change Monitoring</u> | | | | | | | | | | |
| I-35 | C-1 | Monitoring Lake Levels for Hydroelectric Power Application | Major | Beneficial | Well Distributed | Moderate | Embryonic | Concept | Unfavourable | Sufficient |
| I-20 | C-2 | Remote Sensing Power Line Conditions | Moderate | Beneficial | Well Distributed | Moderate | Embryonic | R&D | Average | Sufficient |
| U-21c | C-3 | CCD Array Scanners for water, vegetation analysis | Useful | Beneficial | Concentrated in Existing Areas | Moderate | Non-Existent | Concept | Average | Sufficient |

TABLE 3-2 (Page 2 of 3)

| Index No. | No. | Proposal | Economic Opportunity | STRATEGIC BENEFIT | | | TECHNOLOGY DEVELOPMENT | | | Space Station Advantage |
|-----------------------------------------------|------|---------------------------------------------------------------------|----------------------|-------------------|--------------------------------|--------------------------|------------------------|-------------|-----------------|-------------------------|
| | | | | National Interest | Regional Development | Advancement of Knowledge | Capability | Development | Potential | |
| I-34 | C-4 | Navigation and Remote Sensing Hydrological Applications in B.C. | Moderate | Beneficial | Moderately Distributed | Moderate | Early Growth | Concept | Average | Sufficient |
| G-23 | C-5 | High resolution stereo imagery for Woodlot inventory | Useful | Beneficial | Concentrated in existing areas | Moderate | Early Growth | R&D | Average | Sufficient |
| I-37 | C-6 | Surveying and Mapping of Woodlots during Cutting application | Useful | Beneficial | Concentrated in existing areas | Moderate | Embryonic | Concept | Favourable | Sufficient |
| G-48 | C-7 | High resolution stereo, geo-referenced Imagery for forest inventory | Useful | Beneficial | Concentrated in existing areas | Moderate | Growth | Prototype | Average | Sufficient |
| I-41 | C-8 | Test Ice Space Radar | Minor | Beneficial | Concentrated in existing areas | Significant | Growth | R&D | Average | Necessary |
| G-18 | C-9 | Human observations of icebergs and episodical events | None | Very important | Contributes | Insignificant | Mature | Proven | Unfavourable | Necessary |
| I-54 | C-10 | Pollution (SO_2 , NO_x) Monitoring | None | Beneficial | Concentrated in existing areas | Moderate | Growth | Prototype | Average | Sufficient |
| G-21 | C-11 | Remote Sensing of Migratory Bird Habitats | None | Little importance | Moderately distributed | Moderate | Embryonic | Concept | Unfavourable | Sufficient |
| Sensor and Data Processing Development | | | | | | | | | | |
| I-70 | S-1 | Scanner and Pollution Sensor Development | Major | Very important | Concentrated in existing areas | Significant | Growth | Proven | Favourable | Necessary |
| I-71 | S-2 | Space Laser Radar Development | Major | Very important | Concentrated in existing areas | Very significant | Growth | R&D | Very favourable | Necessary |
| I-36 | S-3 | Testing of Sensors and On-Board Processors | Useful | Beneficial | Concentrated in existing areas | Significant | Mature | Prototype | Favourable | Necessary |
| G-18 | S-4 | On board processing of R/S Data | Moderate | Beneficial | Concentrated in existing areas | Significant | Mature | Prototype | Favourable | Necessary |
| G-19 | S-5 | Multi-Frequency SAR - B -10 KM | Useful | Beneficial | Moderately distributed | Moderate | Growth | R&D | Average | Necessary |
| I-81 | S-6 | High-Resolution Sensors and On-Board Processing | Useful | Beneficial | Well distributed | Moderate | Embryonic | R&D | Favourable | Necessary |
| I-80 | S-7 | CCD Imager | Useful | Beneficial | Concentrated in existing areas | Moderate | Growth | Prototype | Average | Necessary |
| G-30 | S-8 | Wide-Swath Scatterometer | Useful | Beneficial | Concentrated in existing areas | Significant | Non-Existent | Concept | Average | Sufficient |
| G-34 | S-9 | Fluorescence Line Imaging from Space | Minor | Beneficial | Concentrated in existing areas | Insignificant | Early Growth | R&D | Favourable | Sufficient |

TABLE 3-2 (Page 3 of 3)

| Index No. | No. | Proposal Special Applications | Economic Opportunity | STRATEGIC BENEFIT | | | TECHNOLOGY DEVELOPMENT | | | Space Station Advantage |
|-----------|------|------------------------------------|----------------------|-------------------|--------------------------------|--------------------------|------------------------|-------------|-----------------|-------------------------|
| | | | | National Interest | Regional Development | Advancement of Knowledge | Capability | Development | Potential | |
| I-78 | Sp-1 | Spotlight SAR for S.A.R. | None | Very important | Well distributed | Insignificant | Early Growth | Concept | Favourable | Necessary |
| U-21 | Sp-2 | Limb Scanning of the Atmosphere | None | Beneficial | Concentrated in Existing Areas | Very significant | Embryonic | R&D | Unfavourable | Sufficient |
| G-47 | Sp-3 | Planetary Fluid Dynamics Simulator | None | No Importance | Concentrated in Existing Areas | Very significant | Embryonic | Concept | Very favourable | Necessary |

TABLE 3.3

COMMUNICATIONS PROPOSALS

| Index No. | Proposal | Economic Opportunity | STRATEGIC BENEFIT | | | TECHNOLOGY DEVELOPMENT | | | | Space Station Advantage |
|--------------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------|--------------------------------------------|--------------------------------------------------|-----------------------------|------------------------|-------------------------|--------------------------------------------------------|-----------------------------------------------------------------------|-------------------------------|
| | | | National Interest | Regional Development | Advancement of Knowledge | Existing Capability | State of Development | Innovation Potential | | |
| I-7 | Low earth orbit satellite for store and forward video and audio from non-North American satellites. | None | No importance | Could contribute to services in remote countries | Insignificant | Mature | Proven | Average for development of store and forward operation | Necessary | |
| I-75 | Repair, re-supply proving and hardening of telecommunications satellites | Moderate | Beneficial | Concentrated in existing areas | Insignificant | Embryonic | Concept | Favourable | Necessary | |
| I-76 | Provision of space station Communications systems | Minor | No Importance | Concentrated in existing areas | Insignificant | Early growth | R&D | Favourable | Necessary | |
| G-33 | Waves in Space Plasma | Moderate for construction of wave injection facility | Beneficial to maintain Canadian competence | Concentrated in existing areas | Moderate | Mature | Prototype | Favourable | Necessary shuttle times too short, interference from other pay loads. | |

TABLE 3.4

| Index No. | Proposal | Economic Opportunity | STRATEGIC BENEFIT | | | MATERIALS PROPOSALS | | | TECHNOLOGY DEVELOPMENT | | | Space Station Advantage |
|--------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------|-------------------------------------|--------------------------|---------------------|----------------------|----------------------|------------------------|------------|------------|-------------------------|
| | | | National Interest | Regional Development | Advancement of Knowledge | Existing Capability | State of Development | Innovation Potential | R&D | Favourable | Sufficient | |
| I-12 | Investigate the processes by which radiation damage occurs in solid state memories. | Moderate if a method of overcoming the problem is developed. | No importance | Concentrated in existing areas. | Potentially significant | Growth | R&D | Favourable | | | | |
| I-59 I-77 | Build a micro gravity furnace for growing highly-refined Hg-cd-Te crystals. | Minor unless studies reveal advantages for processing in space. | Little importance unless processing in space proves advantageous | Work is well distributed | Insignificant | Early Growth | R&D | Favourable | | | | |
| I-62 | Study of alloy processes in absence of gravity and crucible. | Moderate | Beneficial | Contributes to regional development | Significant | Embryonic | R&D | Average | | | | |
| I-64 | Design and fabricate facilities for materials processing in space | Minor | No importance | Moderately distributed | Insignificant | Early Growth | Concept | Favourable | | | | |
| U-1 | Study of solidification processes in entectics | Minor | Little importance | Moderately distributed | Significant | Growth | R&D | Average | | | | |
| U-9 U-23 G-4 | Study of crystal growth Process in space | Moderate | Little importance | Well distributed | Significant | Embryonic | R&D | Average | | | | |
| U-14 | Study of growth of Bi-Sb single crystals of high quality | Minor | Little importance | Well distributed | Significant | Embryonic | Concept | Average | | | | |
| U-18 | Study of interface phenomena in metallic and semi-conducting crystal growth | Moderate | Little importance | Well distributed | Significant | Embryonic | R&D | Average | | | | |
| U-19a | Effect of space environment on polymer matrix composite materials | Useful for construction of future space structures | Very important if Canada is to undertake construction of space structures | Concentrated in existing areas | Significant | Growth | Prototype | Favourable | | | | |
| G-14 | Materials research in space | Moderate | Little importance | Well Distributed | Significant | Embryonic | Concept | Favourable | | | | |

TABLE 3.5

SPACE SCIENCE PROPOSALS

| Index No. | Proposal | STRATEGIC BENEFIT | | | TECHNOLOGY DEVELOPMENT | | | | | Space Station Advantage |
|----------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------|--------------------------------------------------------|--------------------------------|----------------------------------|---------------------|----------------------|----------------------|--|-------------------------------------------------|
| | | Economic Opportunity | National Interest | Regional Development | Advancement of Knowledge | Existing Capability | State of Development | Innovation Potential | | |
| U-8 | STARLAB | Moderate | Very important extends Canadian competence | Moderately Distributed | Very significant at leading edge | Growth | R&D | Very favourable | | Necessary-needs to be retrieved |
| U-12 U-21d | High resolution spectrographs auroral studies | Minor | Very important auroral studies important in Canada | Moderately Distributed | Significant | Mature | Prototype | Favourably | | Sufficient |
| U-15 | Testing of very long antenna | Useful for Canada's continuing involvement in space | Very important | Concentrated in existing areas | Moderate | Early growth | Concept | Average | | Necessary-shuttle can't handle- |
| U-21e U-21c | Use of space station for advanced WAMDI and electron probe measurements. | Minor | Beneficial as a continuation of Canadian space science | Concentrated in existing areas | Significant | Growth | Concept | Average | | Necessary-requires power and weight capability |
| U-25 | Extension of Canadian Long Base Line Array | Minor | Very important if VLBA project goes forward | Well distributed | Very significant | Early growth | Concept | Favourable | | Necessary to extend VLBA beyond earth stations. |
| G-6 | Assembly and deployment of huge receiving apertures, optical and electrical, for astrophysics research | Moderate | Beneficial to maintain Canadian competence | Moderately distributed | Significant | Growth | Concept | Favourable | | Necessary for assembly |

TABLE 3.6 (Page 1 of 3)

SPACE STATION TECHNOLOGY PROPOSALS

| Index No. | Proposal | STRATEGIC BENEFIT | | | | TECHNOLOGY DEVELOPMENT | | | |
|-----------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|----------------------------------------------------------------------|--------------------------------------------|-------------------------------------|----------------------|----------------------|-------------------------|
| | | Economic Opportunity | National Interest | Regional Development | Advancement of Knowledge | Existing Capability | State of Development | Innovation Potential | Space Station Advantage |
| I-2 | Space Station Construction | Major if Canada decides to participate | Important as part of tech. sovereignty | Concentrated in existing centres | Significant in relation to technology | Growth | Concept | Average | None |
| I-8 | Design and test of a Canada-wide communications and information processing system | Useful as part of Canada's capability | Improved communications equipment | Will moderately distribute industrial activity | Moderate | Growth | Concept | Favourable | Necessary |
| I-16a | Supply of solar arrays for space platforms | Major-based on large market for present line and potential international market | Very important to maintain and increase national capability | Concentrated in existing areas | Significant | Mature - systems have been designed | Prototype | Very Favourable | Sufficient |
| I-16b | Construction and servicing of Space Station | Major-Canada will be a partner in overall program and will contribute substantially to the technology. | Very important to advance national capability | Well distributed-Canadian suppliers available throughout the country | Significant | Mature - based on systems developed | Proven | Very Favourable | Necessary |
| I-16c | Evaluation and control of space structures | Major - tied to construction and servicing | Important as part of national capability | Well distributed-broad base of Canadian competence exists | Significant | Mature | Prototype | Very Favourable | Necessary |
| I-11 | Information display panels and microwave components | Minor benefit | No particular national interest | Concentrated in existing areas | Moderate-as developments will occur anyway | Mature | Concept | Low | Necessary |
| I-34 | Packaging applications for articles in space | Useful as new industry could be developed | Important if Canada joins space station | Possibility for moderate distribution | Insignificant | Embryonic | R&D | Very Favourable | Necessary |
| I-46 | Manufacture of panels, booms, support structures, antennas and wave guides | Useful - some could be high volume | No particular national interest | Impact in a regional area | Only moderate | Mature | Proven | Favourable | Sufficient |
| I-47 | Orbit transfer solid rocket motors and local space traffic control systems | Major opportunity for an industrial leader | Important to maintain capability | Impact in a regional area | Insignificant | Mature | Prototype | Favourable | Necessary |

TABLE 3.6 (Page 2 of 3)

| Index No. | Proposal | STRATEGIC BENEFIT | | | TECHNOLOGY DEVELOPMENT | | | | Space Station Advantage |
|-----------------------|--------------------------------------------------------------------------------|----------------------------------------------------------|--------------------------------------------------|-----------------------------------------|------------------------------------------------------------|---------------------|----------------------|----------------------|-------------------------|
| | | Economic Opportunity | Economic Interest | Regional Development | Advancement of Knowledge | Existing Capability | State of Development | Innovation Potential | |
| I-51 | On-board image analysis and data processing | Useful when used with robotics | Some importance | Concentrated in existing areas | Moderate | Growth | R&D | Favourable | None |
| I-66 | Manufacturing methods in space for mechanical and electrical components | Useful if space is commercialized. | Important as possible Canadian contribution | Probably concentrated in existing areas | Insignificant | Embryonic | Concept | Average | Necessary |
| I-78 | Construction of high reliability energy management systems for spacecraft | Useful | Of little national interest | Concentrated in existing areas | Moderate contribution | Mature | Proven | Favourable | Necessary |
| I-79 | Simulators for spacecraft | Minor-except for spin-offs and maintenance of capability | Important to build on existing capability | Concentrated in existing areas | Moderate-evolutionary | Mature | Prototype | Favourable | Sufficient |
| U-19b | Investigation of the dynamics of large flexible structures | Major as continuation of RMS | Very important as part of space program | Concentrated in existing areas | Very significant growth in field of large structure design | Growth | Prototype | Very favourable | Sufficient |
| U-22 | Design and testing of large solar arrays and space trusses | Useful as part of on-going program | Some importance as part of on-going program | Concentrated in existing areas | Very significant if space construction to materialize | Embryonic | R&D | Very favourable | Sufficient |
| G-31 | New manufacturing techniques and testing of large space structures | Useful to capitalize on superior analytical techniques | Little importance | Concentrated in existing areas | Significant | Mature | R&D | Favourable | Sufficient |
| I-21 | Provision of Payload Development of millimetric microwave technology | Useful opportunity for sales | Very important to enhance Canadian strength | Concentrated in existing areas | Insignificant-principally engineering | Growth | Concept | Favourable | Necessary |
| I-23 | Design manufacture and testing of precision IR and visible spectro photometers | Minor for sale of instruments | No importance | Contributes to regional development | Insignificant | Mature | Prototype | Average | None |
| I-33 U-21i G-26 | Development of Canadian module for space station | Major | Very important as Canada would be a world leader | Contributes to regional development | Very significant | Non-existent | Concept | Very favourable | Necessary |
| I-43 | Payload integration | Moderate | Little importance | Contributes to regional development | Insignificant | Mature | Prototype | Average | Sufficient |

TABLE 3.6 (Page 3 of 3)

| <u>Index No.</u> | <u>Proposal</u> | <u>Economic Opportunity</u> | <u>Economic Interest</u> | <u>Regional Development</u> | <u>Advancement of Knowledge</u> | <u>Existing Capability</u> | <u>State of Development</u> | <u>Innovation Potential</u> | <u>Space Station Advantage</u> |
|--------------------|----------------------------------------------------------------------------------------------------|-----------------------------------------------------|-----------------------------------------------------|-------------------------------------|---------------------------------|----------------------------|-----------------------------|-----------------------------|--------------------------------|
| I-44 | Adaptation of ozone and atmospheric sensors | Useful-might capture a share of monitoring business | Important | Contributes to regional development | Moderate | Mature | Concept | Low | None |
| I-51 | Small scale construction/ fitting <u>Instrument Testing</u> | Moderate | No importance | Concentrated in existing areas | Insignificant | Embryonic | R&D | Favourable | Sufficient |
| I-36 | Testing of sensors and processors | Useful-satellites too long, shuttle too short | Important if Canada is to maintain space capability | Builds on existing strength | Very significant | Early growth | Concept | Very favour-Necessary able | |
| U-19b | Testing of control systems for remote manipulator arms in natural working environment | Useful as a continuation of present programs | Very important | Concentrated in existing areas | Significant | Early growth | R&D | Very favour-Sufficient able | |
| <u>Experiments</u> | | | | | | | | | |
| U-16 | Study of spacecraft charging | Insignificant | Little importance | Concentrated in existing areas | Very significant | Early growth | R&D | Favourable | Sufficient |
| U-21b | | | | | | | | | |
| G-12 | Study of combustion in micro-gravity | Insignificant | Little importance | Concentrated in existing areas | Significant | Non-Existent | Concept | Average | Necessary |
| I-6 | <u>Ground Stations</u> Development, testing and ground control of next generation of spacecraft | Useful for sale off-shore | Little importance | Concentrated in existing areas | Moderate | Growth | Concept | Average | None |

| Index No. | Proposal | STRATEGIC BENEFIT | | SPACE MEDICINE/BIOLOGY PROPOSALS | | | TECHNOLOGY DEVELOPMENT | | | Space Station Advantage |
|--------------|--------------------------------------------------------------------------|--------------------------------------------------------|--------------------------------------------------------------------|-------------------------------------|-----------------------------|------------------------|-------------------------|-------------------------|------------|-------------------------------|
| | | Economic Opportunity | National Interest | Regional Development | Advancement of Knowledge | Existing Capability | State of Development | Innovation Potential | | |
| 60 | Separation of proteins and trace blood elements in microgravity | Moderate | Beneficial | Concentrated in Existing areas | Significant | Non-existent | R&D | Favourable | Necessary | |
| 45 | Develop a biological regenerative closed cycle life support system | Minor | Beneficial | Contributes to regional development | Significant | Embryonic | R&D | Average | Necessary | |
| -61 -55 | Investigate problems to be solved if space colonies are to be developed. | Useful as man-in-space programs progress | Beneficial as may contribute to land systems in harsh environments | Concentrated in existing areas | Significant | Non-existent | Concept | Favourable | Necessary | |
| | Investigate adaptation of nervous system to various gravity environments | Useful if Canadian companies can exploit opportunities | Very important for Canadian astronauts | Concentrated in existing areas | Significant | Growth | R&D | Very favourable | Necessary | |
| -3 | Investigate the effect of gravity on disease and healing mechanisms | Moderate | Beneficial-maintain Canada's reputation | Concentrated in existing areas | Very significant | Embryonic | R&D | Average | Necessary | 10-10 |
| -10 | Investigate technique for cell separation in a microgravity environment. | Moderate | Little importance | Could be moderately distributed | Significant | Embryonic | R&D | Favourable | Sufficient | |
| -20 -62 | Investigation of bone loss in space | Minor | Very important for Canadian astronauts | Concentrated in existing areas | Significant | Embryonic | Concept | Favourable | Necessary | |
| -53 | Use of space station as a gene bank | Moderate as many gene banks are being established | Very important for genetic pools specific to Canadian needs. | Well distributed | Moderate | Non Existent | Concept | Favourable | Necessary | |
| -35 | Biochemical studies in space | None | No Importance | Concentrated in existing areas | Moderate | Non Existent | Concept | Average | Sufficient | |
| -33 | Fish behaviour and evolution in space | Minor | Little Importance | Contributes to regional development | Very significant | Non Existent | Concept | Favourable | Necessary | |

APPENDIX 11

SUMMARY OF ADVANCED PROPOSALS

ADVANCED PROPOSALS DEALING WITH MATERIALS PROCESSING IN SPACE

| Ref. No. | Proposal | Operational use | Demonstration use | Scientific use |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|-------------------------------------------------------------------|------------------------------------------------------|
| U1 | To build a temperature gradient furnace to be placed on a space platform to measure solidification of eutectics and crystal growth | not in short term | reasonable possible in medium term | of fundamental importance in study of crystal growth |
| I64 | To build and supply a facility on space station for growing crystals of very high value which cannot be grown in a gravity field | not in short term | reasonably possible | expected to yield valuable fundamental data |
| I77 | To build a micro-gravity furnace for growing highly-refined crystals of Hg-Cd-Te, a valuable strategic compound | not in short term | reasonably possible | of fundamental scientific importance |
| I59 | To redesign their present furnaces used for growing Hg-Cd-Te and GaAs crystals for use on space station; their customers are requesting higher purity and fewer imperfections | not in short term | reasonably possible | of fundamental scientific importance |
| U23 | To design and experiment with crystal growth in space; is now designing a facility for growing the world's largest crystals of GaAs | not in short term | reasonably possible | expected to yield data of fundamental importance |
| U19a | To design a facility to study the effects of the space environment on structures which could not be simulated on earth, e.g. thermal vacuum cycling, uv radiation and electron bombardment; an extension of present work with NASA | | could affect the design of space craft in the short and long term | |
| B4 | Materials processing in space | possible in long term | reasonably possible in medium term | of fundamental importance in study of crystal growth |
| I21 | To supply a facility for examining radiation damage (temporary or permanent) to solid state memories in space and to design protecting devices | could have an immediate effect on most space activity | immediate | - |

ADVANCED PROPOSALS DEALING WITH SPACE SCIENCE

| Ref. No. | Proposal | Operational use | Demonstration | Scientific use |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------|-----------------------------------------------------------------------------|
| U21e | To design and construct a higher resolution, more sophisticated wide-angle doppler Michelson interferometer than is being made for the Shuttle | - | - | to study coupling between upper and lower atmosphere for weather prediction |
| U21i | To design a Canadian Science Module or sub-satellite to space station that can be operated in an autonomous manner | - | - | multi-scientific use |

ADVANCED PROPOSALS DEALING WITH SPACE TECHNOLOGY

| Ref. No. | Proposal | Operational use | Demonstration use | Scientific use |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| I16a | To supply solar arrays for Space Station | | | of immediate importance for current space programs and as a basic technology for developing advanced systems |
| I16b | To contribute to the construction and servicing of Space Station | | | of importance to the development of Space Station |
| I16c | To contribute to the evaluation and control of space structures | | | of importance as support for construction and servicing |
| G6 | To assemble in space and deploy a very large receiving antenna for radio astronomy | - | possibly could be used also for high resolution passive m/w observation of the earth | this is probably the next important technology step in the astronomical study of the universe |
| U22 | To design and deploy a facility in space station for testing large solar arrays and space trusses | very important in the long term | possibly of medium term importance | - |
| U19b | To design and build a facility in space station to test large space structures under actual space conditions and to design controls for flexible structures | very important in the long term | of medium term importance | - |

ADVANCED PROPOSALS DEALING WITH SPACE MEDICINE/BIOLOGY

| Ref. No. | Proposal | Operational use | Demonstration use | Scientific use |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| I61 | To develop a self-contained ecosystem on space station for food production and processing and for maximizing the recycling of waste | very long term use | possible in medium term | - |
| G62 | Development of automated animal habitat for space station to study biological effects of zero gravity on rats and mice | of short and long term importance | possible results in short term | will increase understanding of fundamental biological processes |
| U3 | Development of facilities in space station for carrying out vestibular physiology projects | of short and long term importance for future space exploration | possible results in short term | limited |
| U5 | Development of facilities in space station for studying the effects of variations in gravity on the blood, lungs and heart | | of immediate practical and scientific importance both in the treatment of disease on earth and for space-related problems in astronauts | |
| U10 | To design and build a facility in space station to investigate techniques for cell separation in a micro-gravity environment | of long term importance | reasonably possible in medium term | fundamental bio-technology research |
